

Computing machines architecture

Dr. Giuseppo Maggiore

Computing machines architecture

Dr. Giuseppe Maggiore

Hogeschool Rotterdam Rotterdam, Netherlands

Introduction

Computing machines architecture

Dr. Giuseppe Maggiore

Lecture topics

- We discuss the actual computational elements of a computer
- We bridge what we have seen in the previous lecture with actual computer architectures

Structure of a computer

Computing machines architecture

Dr. Giuseppe Maggiore

Computational elements at a glance

- CPU
- Memory

Computing machines architecture

Dr. Giuseppe Maggiore

CPU

- Read the current instruction from memory based on the PC
- Evaluate the instruction
 - Read and write memory elements as needed
- Write the PC of the next instruction

Computing machines architecture

Dr. Giuseppe Maggiore

CPU instructions

- Machine instructions
- Significantly smaller than what we use
 - Register manipulation add, sub, mul, ...
 - Memory manipulation by integer address lw, sw
- Concrete programming languages instructions equal many machine instructions

Computing machines architecture

Dr. Giuseppe Maggiore

Machine vs programming language instructions

- There are different sorts of programming languages
- Some higher level, some lower level
- Lower level languages instructions equal few (even as low as one) machine instructions

Computing machines architecture

Dr. Giuseppe Maggiore

Machine vs programming language instructions

- There are different sorts of programming languages
- Some higher level, some lower level
- Lower level languages instructions equal few (even as low as one) machine instructions
- Higher level languages instructions equal many (even as high as tens) machine instructions

Memory and data

Computing machines architecture

Dr. Giuseppe Maggiore

Memory

- Data is stored into memory
- Memory is just a long linear stream of bytes
- CPU queries memory by address
- CPU updates memory with address and data

Computing machines architecture

Dr. Giuseppe Maggiore

Typical programming language elements

- Intuitive instruction names
- Higher level flow-control operators
- Labeled data through variables
- Higher level data manipulation operators

Computing machines architecture

Dr. Giuseppe Maggiore

Instruction names

• Machine instructions have names that are hard to pierce

Computing machines architecture

Dr. Giuseppe Maggiore

Instruction names

- Machine instructions have names that are hard to pierce
 - What is the meaning of instruction 0xDEBC318A?

Computing machines architecture

Dr. Giuseppe Maggiore

Instruction names

- Machine instructions have names that are hard to pierce
 - What is the meaning of instruction 0xDEBC318A?
 - What is the meaning of instruction currentUserAge := currentUserAge + 1?

Computing machines architecture

Dr. Giuseppe Maggiore

Higher level flow-control operators

- Machine instructions are tiny
- Many standardized behaviors require lots of machine instructions

Computing machines architecture

Dr. Giuseppe Maggiore Consider a *fictional* machine language listing vs its high-level equivalent:

```
lw r1 r3
cmpi r0 r3 18
jmpsz ELSE
lw r4 r3
addi r3 r3 1
                if userAge >= 18 then
sw r4 r3
                  adultUsers := adultUsers + 1
jmp END
                else
ELSE:
                  youngUsers := youngUsers + 1
lw r5 r3
addi r3 r3 1
sw r5 r3
F.ND:
. . .
```

Computing machines architecture

Dr. Giuseppe Maggiore

Variables

- Program data is stored into variables
- Variables label memory data
- Labels simplify reasoning

Computing machines architecture

Dr. Giuseppe Maggiore

Variables

- Program data is stored into variables
- Variables label memory data
- Labels simplify reasoning
 - What is the meaning of 0xA0DF9931?

Computing machines architecture

Dr. Giuseppe Maggiore

Variables

- Program data is stored into variables
- Variables label memory data
- Labels simplify reasoning
 - What is the meaning of 0xA0DF9931?
 - What is the meaning of userAge?

Computing machines architecture

Dr. Giuseppe Maggiore

- Program data in memory has no fixed structure
- We can read 48 bytes instead of 32, and get 16 bytes of garbage for free
- This causes errors

Computing machines architecture

Dr. Giuseppe Maggiore

- Variables give a *type* to memory data
- Types simplify reasoning

Computing machines architecture

Dr. Giuseppe Maggiore

- Variables give a *type* to memory data
- Types simplify reasoning
 - How many bytes should I read at address 0xA0DF9931?

Computing machines architecture

Dr. Giuseppe Maggiore

- Variables give a type to memory data
- Types simplify reasoning
 - How many bytes should I read at address 0xA0DF9931?
 - How many bytes should I read for integer userAge^a?

^aKnowing that integers are 4 bytes on 32 bit machines and 8 bytes on 64 b machines

Computing machines architecture

Dr. Giuseppe Maggiore

Yet more

- Higher level programming languages do even more
- Handle custom and complex computations (functions, events, continuations, lambda's)
- Handle custom and complex data structures (structs, classes, tuples, ...)

This is it!

Computing machines architecture

Dr. Giuseppe Maggiore

The best of luck, and thanks for the attention!
